# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). All other cases are classified as "disease", bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties.

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

### MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant".

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## COMMENT ON CURRENT TRENDS

### CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

#### All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes and from disease both decreased again by about 4 percent. Lower morbidity from respiratory causes was only partly responsible for this decline. For the week ending 31 March 1944 the admission rate from all causes was reported at 660 per year per thousand while the admission rate from disease was reported at 595 per year per thousand, both being about 30 percent below the corresponding rates for the week ending 2 April 1943. It is noteworthy that morbidity from all causes and from disease has shown a steady downward trend during the first quarter of 1944, whereas admission rates during the corresponding period of 1943 remained practically level.

For the week ending 31 March 1944 morbidity from injury was reported at 65 per year per thousand or a marked drop from the very low level which has prevailed in recent months.

#### Respiratory Causes:

The admission rate from colds, influenza, etc. continued downward and for the week ending 31 March 1944 was reported at 184 per year per thousand or about 7 percent lower than for the preceding week. Since about the middle of January 1944, morbidity from these causes to date has been increasingly lower (approximately 30-40 percent lower) than for the corresponding period of last year. The admission rate from all forms of pneumonia continued at 15 per thousand or more than 30 percent under the rate for the corresponding week of 1943.

#### Common Communicable Diseases:

New cases of mumps decreased somewhat from the record figure reported for the preceding week. New cases of measles and scarlet fever both increased slightly. The number of new cases of meningitis was also reported lower and a decline likewise was registered in the number of new cases of rheumatic fever.

### VARIATIONS IN MORBIDITY BY SERVICE COMMAND:

#### All Causes: Disease and Injury:

Marked increases in admission rates from all causes and from disease were noted in the Fifth and First Service Commands while the Third and Sixth (and to a lesser extent, the Seventh and Fourth Service Commands) reported substantial declines in morbidity. The higher morbidity reported from the Fifth and First Service Commands was apparently associated with recent movements of troops out of and within these Service Commands. Lower admission rates from respiratory causes were largely responsible for the declines in morbidity in the Third and Seventh Service Commands. As a result of the sharp decrease in morbidity in the Sixth Service Command, the Second Service Command displaced the Sixth Service Command as the one with the highest morbidity from all causes (862 per

# NON-EFFECTIVE RATE

# PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

# WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 31 MARCH 1944

## COMMENT ON CURRENT TRENDS (CONT'D)

thousand) and from disease (813 per thousand). The Eighth Service Command reported the lowest morbidity from all causes (576 per thousand) and continued to experience the lowest morbidity from disease (510 per thousand). The admission rate from injury increased sharply in the First Service Command and showed a substantial drop in the Fourth and Fifth Service Commands.

### Respiratory Causes:

The Eighth, Fifth and First Service Commands reported slightly higher admission rates from colds, influenza, etc. while all the other Service Commands experienced lower admission rates, with the largest decreases being reported by the Third and Seventh Service Commands. The Sixth Service Command continued to show the highest admission rate from colds, influenza, etc. (336 per thousand) while the lowest admission rate (133 per thousand) was reported by the Fourth Service Command. A sharp decline in morbidity from pneumonia was registered in the Military District of Washington while increases were reported in the First and Sixth Service Commands. The latter continued to have the highest morbidity from pneumonia (40 per thousand).

### Common Communicable Diseases:

The Second and Third Service Commands experienced somewhat higher morbidity from Venereal Diseases (excluding EPTS cases). During the week ending 31 March 1944, the Third Service Command showed the highest morbidity from these causes (42 per thousand). New cases of mumps decreased in the Third and Seventh Service Commands and the Military District of Washington and increased in the Eighth, Sixth and First Service Commands; the Fourth Service Command, nevertheless, continued to account for over 30 percent of the total number of new cases of mumps. The Fourth Service Command also continued to account for nearly 30 percent of the new cases of measles and for nearly 40 percent of the new cases of meningitis. The Seventh Service Command reported the highest proportion of scarlet fever cases (about 25 percent) and of rheumatic fever (over 30 percent).

### NON EFFECTIVE RATE:

The non-effective rate declined slightly for the fifth successive week and was reported at 37.4 per thousand strength for the week ending 31 March 1944. This is the lowest non-effective rate experienced since last September.

The variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity by Service Command as the different numbers of General Hospitals in each Service Command. When comparisons are made between the non-effective rates for each of the Service Commands excluding General Hospitals, the variations are seen to be very much smaller than when the days lost in General Hospitals are included.

# HOSPITALIZATION DATA

## CONTINENTAL UNITED STATES

# WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 31 MARCH 1944

## COMMENT ON CURRENT TRENDS (CONT'D)

### PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week decreased to about 36 per thousand strength.

Since the last week of January 1944 the number of neuropsychiatric cases remaining has fluctuated in the range from 16,000 to 17,000 and for the week ending 31 March 1944 was reported at 16,061. The number of malaria cases under treatment has declined in recent weeks from a high of 2230 on 25 February to 1927 on 31 March 1944; only 23 of the 1927 malaria cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1076 as of 31 March 1944.

### CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 31 March 1944 was reported at about 381,500 or 3000 more than at the end of the previous week. The number of beds occupied was nearly 156,000 or 4000 less than at the end of the previous week, while the number of "available vacant" beds increased to almost 150,000. Total beds occupied represented 41 percent of total bed capacity. There were 14 stations with bed capacity of about 7,400 having no "available vacant" beds; one General Hospital with a bed capacity of 900 was included among these stations.

The number of normal beds reported remained stationary during the week and as of 31 March 1944 was reported at about 297,000 or 78 percent of the total bed capacity. Included in the normal bed capacity on 31 March 1944 were 9950 T/O hospital beds and tentage, mostly in maneuver areas, while the total bed capacity included 10,523 such beds.

The total bed capacity of General Hospitals, which has shown a steady increase in recent months, was reported at about 104,000 as of 31 March 1944. On the same date about 49,000 of these beds (or 47 percent) were occupied. The "available vacant" beds at General Hospitals numbered 34,000 as of 31 March 1944. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of beds in maneuver areas mentioned above) has remained practically level since the beginning of the year at about 275,000 beds, while the normal beds in these hospitals declined sharply from 250,000 as of 7 January 1944 to 212,000 as of 31 March 1944. Total beds occupied as of 31 March 1944 numbered 107,000 or about 38 percent of the corresponding total bed capacity. Station Hospitals had 116,000 "available vacant" beds as of 31 March 1944, the highest number yet reported.

As of 31 March 1944 the bed capacity of convalescent facilities in General Hospitals numbered 9916 beds of which 4,108 beds, or 41 percent, were occupied.
